PROFESSIONAL SUMMARY

Senior Backend Software Engineer with 7+ years of experience building scalable microservices, distributed systems, and AI infrastructure. Specializes in high-throughput AI gateways, resilient load balancing, retrieval pipelines, and security-sensitive integrations. Brings end-to-end ownership from architecture and implementation through production operations, performance analysis, and mentoring.

EXPERIENCE

MONDAY.COM | SENIOR BACKEND ENGINEER, AI GROUP
2025 -- Present | Tel Aviv

- Built and operate the shared **AI Gateway and SDK** used across monday.com products, providing one OpenAI-compatible interface for multiple LLM providers and models. Own production adoption and operations, including model support, incident response, integration support, and reliability and cost monitoring.
- Designed a distributed **AI load balancer** across providers, accounts, regions, and rate limits. It protects quotas while consistent hashing keeps sessions from multi-region gateway deployments pinned to the same provider server.
- Built an account-level **embedding pipeline** that represents monday.com board structure—including columns, types, and sections—to enable semantic board discovery beyond exact-name or lexical search.

SAVVY SECURITY | BACKEND SOFTWARE ENGINEER
May 2022 -- 2025 | Ramat Gan

- Designed a Firestore-backed, cross-device **throttling system** for Chrome-extension security playbooks, scaling to **100K+ users**. Added transactional coordination across administrators to prevent duplicate work and conflicting shared state.
- Initiated and built a distributed **Redis authentication-token cache** across backend deployments. It respected token expiration and reduced request CPU time by **about 30%**, measured with Go pprof.
- Designed a resilient extension authentication flow that reused browser sessions for low-friction sign-in and recovered safely from token expiry, extension restarts, and devices waking after long sleeps. Owned critical third-party **OAuth and JWT** integrations and core backend services.

CORE SKILLS

LANGUAGES Go •

TypeScript • Node.js •
Python • C++ • SQL

Additional: JavaScript, Zig,
Tcl, C, Bash, Assembly, Java

AI & DATA AI gateways •

LLM APIs • RAG •
embeddings • OpenAI
API • LangChain • Ollama

SYSTEMS GCP • Docker •

Linux • Firestore • Redis •
Datadog • NoSQL •
REST • caching • load
balancing

STRENGTHS Platform

ownership • distributed
systems • performance
analysis • security
integrations • mentoring

EDUCATION

BAR-ILAN UNIVERSITY

B.ENG. COMPUTER ENGINEERING
2022 | Givat Shmuel
GPA: 90

EXPERIENCE CONTINUED

INTEL CORPORATION | DESIGN AUTOMATION ENGINEER, CCAD
2019 -- May 2022 | Haifa

- Developed and maintained **CAD automation** and layout-verification workflows for next-generation CPU manufacturing technologies.
- Wrote Tcl integrations for Synopsys Fusion Compiler and Cadence tooling, adapting existing systems and creating new workflows as manufacturing methods and design requirements evolved.
- Partnered directly with physical-design engineers to investigate failures, encode manufacturing requirements into repeatable checks, and improve validation accuracy and team productivity.

SELECTED PROJECTS

QUARTO PRESENTATION GENERATOR

- Built an **AI-powered** service that turns an article into a structured Quarto RevealJS presentation, including slide content, structure, speaker notes, and a renderable .qmd output.
- Added centralized prompt management and multi-model support for OpenAI, Anthropic, and local Ollama models.

WT-CLAUDE

- Created a CLI for parallel development with Git worktrees: it creates or resumes worktrees in a predictable location and opens an iTerm session running Claude Code in the correct directory.
- Added repository discovery and reusable system prompts to make the workflow practical across multiple projects.

TCL OUTLINE FOR VS CODE

- Built a VS Code extension for navigating large Tcl automation files, using regular expressions and brace matching to expose procedures and nested code in the Outline view.
- Originated from Intel automation files often exceeding 2,000 lines; the extension has **2,000+ users**.

PICTIONARY AI

- Built a real-time drawing game powered by a local Ollama vision model; queues drawing updates to keep the experience responsive despite local-model inference latency.
